

Making sense of data to improve education

2010/ED/EFA/MRT/PI/46

# Background paper prepared for the Education for All Global Monitoring Report 2010

Reaching the marginalized

# Estimating the costs of achieving Education for All in low-income countries

Education Policy and Data Center (EPDC) and UNESCO 2009

This paper was commissioned by the Education for All Global Monitoring Report as background information to assist in drafting the 2010 report. It has not been edited by the team. The views and opinions expressed in this paper are those of the author(s) and should not be attributed to the EFA Global Monitoring Report or to UNESCO. The papers can be cited with the following reference: "Paper commissioned for the EFA Global Monitoring Report 2010, Reaching the marginalized" For further information, please contact efareport@unesco.org

Estimating the costs of achieving Education for All in low-income countries

Education Policy and Data Center (EPDC) and UNESCO

December 2009

Background paper for the EFA Global Monitoring Report 2010

# Acknowledgements

The background paper and the work it reports were undertaken by:

Education Policy Data Center: Annababette Wils, HyeJin Kim, Ania Chaluda, Ben Sylla, Lisa

Kaufman, Joe Goodman, Roshini Ebenezer

**UNESCO**: Samer Al-Samarrai and Caine Rolleston

The background paper benefited from four other papers commissioned at the same time:

- 1. Bennell, P. 2009. A review of EFA expenditure projections made by national education plans in Sub-Saharan Africa
- 2. Chanamuto, N. 2009. Annotated bibliography on the costs of reaching and teaching the marginalized
- 3. Chang, G.-C., Martinez, R. and Mputu, H. 2009. Estimating the costs of education development: Case study for Democratic Republic of Congo, Nigeria and Sudan
- 4. Rolleston, C. 2009. Financing primary education for all: Trends Post-Dakar and the importance of growth

We are grateful to the following for providing advice, data and comments on specific components of the exercise; Paul Bennell, GC Chang, Luc Gacougnolle, George Ingram, Greg Loos, Kurt Moses, Mary Joy Pigozzi and Jan Van Ravens.

#### 1. Introduction

This paper outlines the methodology and the results of an exercise used to estimate the costs of achieving the Education for All (EFA) goals in low-income countries by 2015. The study focuses on low income countries because they are often furthest off track to meet the EFA goals. Getting back on track will require substantial increases in education spending. The study shows that most low-income countries can do more in support of the goals by devoting a larger share of their national budget to education. However, increased domestic resource mobilisation alone will often be inadequate and international aid will be needed. In the Dakar Framework of Action rich nations promised increases in aid to ensure that 'no countries seriously committed to education for all will be thwarted in their achievement of this goal by a lack of resources' (para 10). The study estimates the level of external financing required to fulfil this commitment.

The methodology for the study draws heavily on previous studies that have attempted to cost the education goals and estimate financing gaps (see Table 1). The current study can therefore be seen as an attempt to update previous studies taking account of recent progress in education and its financing.

Table 1: Previous estimates of achieving education goals (constant 2007 prices)

Study	Goals covered	Countries covered	Average annual costs (all countries)	Average annual financing gaps (all countries)	Notes
Bruns et al (2003) and World Bank (2002)	Universal Primary Education	47 low-income countries	\$19.9 billion	\$4.2 billion	Universal primary completion is used as target for UPE. Estimates are also provided for all low income countries and for middle income countries too. Financing gap reported based on scenario C2.
UNESCO EFA (2002)	Universal Primary Education	47 low income countries	-	\$6.7 billion	Study is based on a World Bank (2002) study but assumes that domestic resources grow more slowly.  Also includes costs to introduce demand side financing mechanisms for girls and poor children, interventions for HIV/AIDS and providing education in humanitarian emergencies
UNESCO EFA (2006)	UPE Literacy ECCE	All low-income countries	-	\$12.5 billion	Study is based on UNESCO EFA (2002) but includes:  a. Rehabilitation and infrastructure costs included in original Bruns et al (2003) study.  b. Additional financing gap associated with other low-income countries.

<sup>&</sup>lt;sup>1</sup> Only studies that have attempted to estimate financing gaps have been included in the table. For a summary of other exercises that have estimated the cost of universalising primary education see UNESCO (2002).

	c. Estimate of the financing gap associated with achieving literacy and ECCE.
	d. Adjustment of aid shortfalls
	between 2000 and 2004.

Notes: The financing gap is the difference between the total investment requirement indicated by the costing exercise and levels of domestic financing associated with all the countries involved.

Costing exercises of this kind are only meant to provide a broad indication of the level of resources required to achieve EFA. They do not provide a country specific guide to the appropriate policies and reforms necessary to achieve EFA. They are also not able to provide an assessment of the human and physical capacity of national education systems to undertake the massive and rapid investment programmes necessary in many low-income countries. However, they do provide an indication of the size of the challenge national education administrations face and an indication of the feasibility of achieving the goals by 2015.

The next section outlines the methodology and the data used in the study to estimate the costs of achieving the EFA goals. Section 3 reports on which EFA goals are included and how they have been interpreted for the exercise. It also describes the set of assumptions governing the evolution of key cost parameters (e.g. pupil teacher ratios, teacher salaries etc.) over the projection period. Section 4 presents the estimated costs of achieving EFA. Section 5 analyses the extent to which these costs can be covered by domestic resources and reports on the remaining financing gaps. Conclusions are offered in the final section.

The study generated a large amount of information and analysis. A set of appendix tables provide detailed information on the data used and the results for each low-income country. This information and the models used to estimate the costs are also available online (www.epdc.org/policytools).

## 2. Methodology and data sources

#### 2.1 Using a simulation model to estimate the costs of achieving EFA

A simulation model was developed to estimate the cost and resource implications of achieving the EFA goals in low-income countries by 2015. The model takes an approach related to earlier models that compare an education systems costs with the resources available (see for example, UNESCO, 2005). In its basic form, the model calculates costs by multiplying projections of the number of school places

required in each year by the cost of providing each school place. It then compares these costs with projections of the government resources that are likely to be available in each year.<sup>2</sup>

The model used for the costing exercise includes most of areas covered by the EFA goals. It includes preprimary, primary and lower secondary levels of education as well as adult literacy programmes. It does not, however, have the ability to cost out ECCE programmes before the pre-primary level, technical and vocational education, and other adult learning programmes beyond literacy.

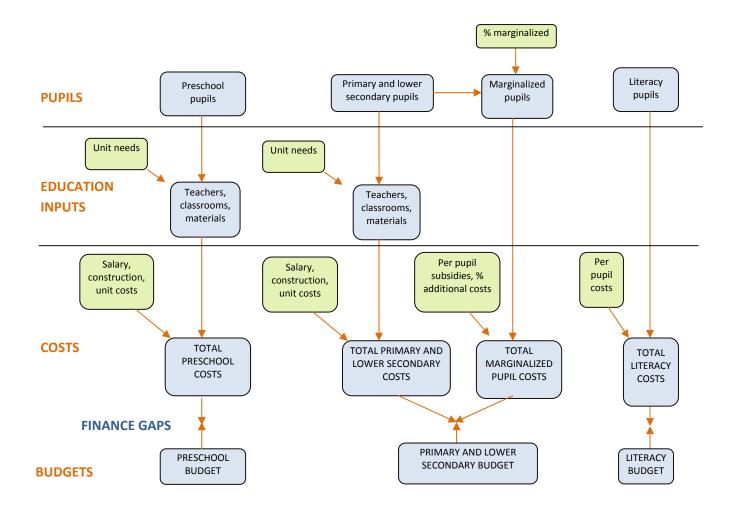

The model uses a set of user inputted targets to project key education parameters from a base year to 2015.<sup>3</sup> If for example, a target pupil teacher ratio is set at 40 and the base year value is 60 the model calculates the average annual decline between the base year and 2015 necessary to achieve the target pupil teacher ratio. For each country included in the costing exercise, information on the main education indicators is required for a base year. For most countries, 2007 was the latest year in which most education data was available and this was chosen as the base year for all countries.

Figure 1. Overview of simulation model

-

<sup>&</sup>lt;sup>22</sup> A detailed description of the model and how it works is available in EPDC (2009b).

<sup>&</sup>lt;sup>3</sup> The simulation model used for the costing exercise can provide projections to 2025. However, the main focus of the costing study is to determine the financial feasibility of achieving the EFA goals by 2015. For simplicity this section discusses projection procedures from 2007 to 2015. However, similar procedures are used to make projections between 2015 and 2025. Section 5.3 looks at the sustainability of education systems by looking at these longer term projections.

The simulation model can be divided into four components: projections for pupils; for education inputs; for costs; and budgets (see Figure 1). The first of the model's components projects enrolment for each level of education between a base year and 2015. Pre-primary projections are based on targets for gross enrolment rates. Primary and lower secondary enrolments are projected on the basis of admission, repetition, promotion and drop-out rates. Targets for these parameters are entered into the model for 2015 and projections are based on achieving these targets. For example, if a target primary school admission rate of 100% is entered for 2015 the model will calculate the annual increase/decrease from the base year value required to achieve the 2015 target. Based on these calculations the number of children entering primary school can be calculated for each projection year. <sup>4</sup>

<sup>&</sup>lt;sup>4</sup>School age population projections are also included in the model to calculate levels of admission (where applicable) and enrolment rates. These are based on the latest UN population projections.

Projections of adult literacy rates are based on assumptions regarding literacy attainment in formal school and levels of projected enrolment in adult literacy programmes. It is assumed that children completing five years of primary schooling are literate. The simulation model includes these children in the adult literate population once they reach the age of 15. The targets are set for the number of adults participating and graduating from literacy programmes. The model projects adult literacy rates from the base year to 2015 based on these two contributing factors.

The second component of the simulation model calculates the number of teachers and classrooms required to accommodate projected levels of enrolment. Projected need is primarily based on targets for pupil-classroom and pupil-teacher ratios. These are supplemented with assumptions on levels of teacher attrition and classroom depreciation to calculate annual needs between the base year and 2015.

Teacher and classroom needs are combined with targets for salaries and construction costs in the third component. Targets for the average teacher salary at each education level in 2015 are used to project teacher costs. In a similar way, the cost of classroom construction at each education level is projected from the base year to 2015. Additional recurrent resources, such as books and learning materials (non-salary recurrent spending) are not modelled explicitly. However their costs are included by setting targets for the proportion of total recurrent costs devoted to non-salary spending.

The final component of the simulation model allows domestic resources for the education sector to be projected. Targets for 2015 are set for the size of government revenues as a proportion of GDP, the proportion of the government budget that is spent on education and the composition of the education budget. For each year between the base year and 2015 it is therefore possible to compare projected costs based on the targets chosen with projected levels of domestic resources. Differences between projected costs and resources are reported as financing gaps/surpluses in the model.

A key feature of the simulation model used in this costing exercise is its ability to model programmes targeted at marginalized groups. Targets can be set for the proportion of the school age population reached by these programmes at the primary and lower secondary level. Two different types of interventions can be modelled. On the demand side, interventions that provide a subsidy expressed as a percentage of GDP per capita for each marginalized child can be included. On the supply side, additional resources as a proportion of total recurrent costs can be included for schools serving marginalized groups.

#### 2.2 Data sources and estimation

Collecting reliable and consistent information on education systems and their financing in low-income countries represents a substantial challenge. To ensure the inclusion of as many low-income countries as possible it was necessary to go beyond international sources of data (e.g. UNESCO Institute of

<sup>&</sup>lt;sup>5</sup> The simulation model does not project the number of graduates from teacher training colleges or include the costs of training new teachers.

Statistics, World Bank and the International Monetary fund) and collect information from sector studies and other relevant reports (see Box 1). A full list of the data sources used for each low-income country included in the study is reported in Appendix Table A2.

#### Box 1: Sources of information for the base year

Detailed information on the education systems of 46 low-income countries were collected for 2007. The data included information on the size of school-age populations, the structure and capacity of school systems, student progression rates (e.g. promotion, repetition and dropout rates), the magnitude of key costs such as teachers, classrooms and levels of domestic spending on education. Three main international sources of data were used:

- UN World Population Prospects database for information on school-age populations and projections of population growth;
- The UNESCO Institute of Statistics for information on enrolment, teachers, classrooms and education financing.;
- World Bank and IMF for information on overall government revenues and economic growth projections.

These were supplemented by over 30 other sources, including national education sector reports and plans and public expenditure reviews. Information was also collected directly from UNESCO offices and other studies commissioned for the costing exercise (see for example, Bennell, 2009; Chang et al., 2009).

All countries classified by the World Bank as low-income in October 2009 with populations above 1 million were initially selected to be included in the costing exercise. Of this group, it was not possible to collect the required information for the Democratic Republic of Korea. Therefore, 46 low-income countries were included in the study. Northern and Southern Sudan are included separately in the study because of their separate education systems.

Information was frequently available for the same indicator from multiple sources. In these cases, a ranking of sources was used to select the information used:

- 1. **First preference** International databases. These sources were assessed to provide the most reliable comparative information.
- 2. **Second preference** National reports on education planning and national education databases. Data in these sources are officially sanctioned but may not be internationally comparable because of differing indicator definitions.
- 3. **Third preference** Special studies and reports containing data on specific topics usually based on special access to national data sources.

<sup>&</sup>lt;sup>6</sup> Comoros, São Tomé and Principe and the Solomon Islands were not included because their populations were below 1 million.

4. **Fourth preference** - National household survey data. Studies have shown that indicators based on household survey data are different to the same indicators based on administrative data. Since most of the information used in the costing exercise is based on administrative data, household surveys were used only where administrative sources were unavailable.

Many indicators used in the costing exercise were not available directly and had to be calculated from other indicators. For example, average teacher salaries as a percentage of GNP per capita were frequently unavailable. However, information on total teacher salary expenditure, the total number of teachers and GNP per capita were used to calculate this indicator. Approximately 1% of the data points for the base year were calculated in this way.

In a small number of cases, regional aggregates were used where no national data was available (see EPDC 2009a). For example, drop-out rates for four countries were estimated in this way. Where it was not possible to calculate regional averages, estimates were made based on findings from other studies. For example, consistent information on classroom construction costs were unavailable for most countries and estimates were based on a study of classroom construction costs in Africa (Theunynck, 2009). In other cases proxies were used. For example, pupil teacher ratios were used to proxy for pupil classroom ratios (see Annex Table 1).

Different sources of information on government financing often provide very different indicators of government education spending. These differences are important because they can lead to different estimates of the resources that are likely to be available to meet the costs of achieving EFA. Of particular concern are differences, across international sources, in the share of the government budget devoted to education as a whole and across education levels. A recent study comparing data from the Fast Track Initiative and the UNESCO Institute of Statistics showed differences as high as 44% between these sources for the share of the recurrent budget going to education (Rawle, 2009). Different sources of information on government spending, the use of budgeted versus actual expenditure and the extent to which aid is included account for some of the discrepancies. However, the lack of a consistent database with wide country coverage seriously limits the accuracy of information on government resources.

In collecting information for the costing exercise every effort was made to use the best available data. That said, large margins of error do exist on many of the indicators used and this suggests that the reported estimates can only be indicative of the magnitude of financing gaps in low-income countries.

#### 2.3 Limitations of the approach

In order to achieve the EFA goals many low-income countries will need to increase education provision substantially and at rates with no historical precedent. The extent to which individual countries have the ability and skills to embark on such ambitious investment programmes even in the absence of resource

<sup>&</sup>lt;sup>7</sup> The same methods were used to calculate an indicator from its component parts for all countries where this was necessary.

<sup>&</sup>lt;sup>8</sup> Information on government revenues collected from different sources can also exhibit large differences.

constraints is not explored. While a number of low-income countries have made rapid progress towards some EFA goals (e.g. Ethiopia and Tanzania) it is unclear whether all low-income countries have the human and physical capacity in their administrations to move at the required rate.

Comparisons between the financing gaps estimated in this study and those in national education plans were made where possible. These comparisons revealed both similarities and large differences. Where it was possible to unpick differences these stemmed largely from differences in the data being used (e.g. the year costings were undertaken and the data used) and differences in the targets and assumptions governing the evolution of key cost parameters. Global costing estimates of the kind generated in this study can give a ball-park figure of the costs associated with achieving goals on the assumption that all countries follow a similar reform path. But paths will be very different for different countries and will imply different costs for achieving the goals.

## 3. Setting the targets and cost parameters for achieving EFA

The simulation model and data outlined in the previous section are used to project the annual costs for the education sector based on the assumption that each low-income country will achieve the EFA targets by 2015. Setting targets for the size of the education system is only the first step. The appropriate mix of inputs to achieve these goals is also required. For example, a costing exercise of this kind needs to set sensible targets for pupil teacher ratios to ensure that the required school places are affordable and at the same time make sure that class sizes are small enough to provide an acceptable level of education quality.

Setting an appropriate mix of inputs in a global costing exercise of this kind is difficult because country context is vital in understanding what is possible. Ideally, the aggregated costs associated with national planning exercises would provide a truer estimate of achieving the EFA goals. However, even where these plans exist they are often partial or incomplete and as yet do not provide the necessary information (Bennell, 2009). The approach taken in the current exercise is to build on the norms used in previous estimates of the costs of achieving EFA.

Some of the EFA goals have clearly quantifiable targets set in association with them. For example, the goal of universal primary education requires all children of primary school age to complete a full cycle of primary schooling. Estimating the costs associated with achieving goals of this kind are relatively straightforward. Other EFA goals do not have clearly quantifiable targets and this makes it more difficult to estimate the costs of achieving them. For example, the ECCE goal involves 'expanding and improving comprehensive early childhood care and education, especially for the most vulnerable and disadvantaged'. However, it does not provide a clear guide to the level of coverage of these programmes which makes it impossible to estimate costs associated with the target directly. These difficulties result in some of the EFA goals being covered only partially in the costing exercise. Where other studies have defined quantifiable targets for the goals these have been used as a starting point to

set targets in the current study. Table 2 provides a summary of the way the goals have been quantified for the purpose of the study.

Table 2: Targets for the costing exercise

EFA Goal	Costing exercise target	Criteria for goal achievement by 2015	Average for 46 low- income countries (circa 2007)	Target for 2015
I <sup>9</sup>	Early childhood care and education	Providing pre-primary schooling for all children living below the poverty line	Pre-primary gross enrolment ratio = 16%	52%
II	Universal primary education	Provision of school places of good quality for all children of primary school age	Primary gross enrolment ratio = 95%  Primary net enrolment	108%
			ratio = 72%	100%
III	Expansion of lower secondary schooling	Provision of places in lower secondary school for all children completing primary school	Primary to secondary transition rate = 69%	100%
			Lower secondary gross enrolment ratio =44%	83%
IV	Adult literacy	Literacy places for all adults to ensure that illiteracy rates are halved	Adult literacy rate = 59%	80%
V	Gender parity and equality	Gender equity in primary, lower secondary schooling and provision of literacy to ensure male and female literacy rates are the same		-
VI	Education quality	Range of quality enhancing interventions included		See Table 3

Notes: targets for early childhood education and adult literacy are country specific. The target included in the table is the average for all 46 countries included in the study. Primary GER targets are country specific but imply full enrolment of primary school age children with a maximum of 10% repetition.

#### Early childhood care and education

ECCE covers a wide range of programmes to support children's development from birth to entry into primary school. Successive UNESCO Global Monitoring Reports have demonstrated the centrality of ECCE in the EFA agenda (UNESCO, 2006). Successful policies in the early years can reap large benefits in education and beyond. Targets have not been included in the current costing study for programmes aimed at children below the official starting age for pre-primary education. This is not to suggest that

\_

<sup>&</sup>lt;sup>9</sup> For a list of the EFA goals see (UNESCO, 2008)..

these programmes are unimportant. However, these programmes frequently lie outside the responsibility of Ministries of Education and to include them would therefore expand the scope of the study considerably. Furthermore, much of the additional information required (e.g. the different types of provision, their costs and levels of government support) to undertake this wider exercise is currently unavailable.

Ensuring that all children from poor households have access to public pre-primary education by 2015 was used as the target for ECCE (see Table 2). Estimates of children living below the poverty line were calculated using poverty headcount ratios for 2005 calculated by the World Bank (World Bank, 2009). 

It was not possible to calculate the number of poor children currently attending pre-primary school. 
However, in many of the countries covered provision is limited and poverty rates are high suggesting that the proportion of poor children enrolled is low. 

Therefore, in countries where the size of current pre-primary provision was insufficient to enrol all poor children the target was calculated by adding together current enrolment rates and the percentage of children living below the poverty line. 

Expansion to provide places for children living below the poverty line was assumed to be government financed. Where current provision significantly exceeds the school places required to enrol poor children, no further increase in the pre-primary enrolment rate was targeted. It was expected that by 2015, sufficient school places would be targeted towards the poorest children.

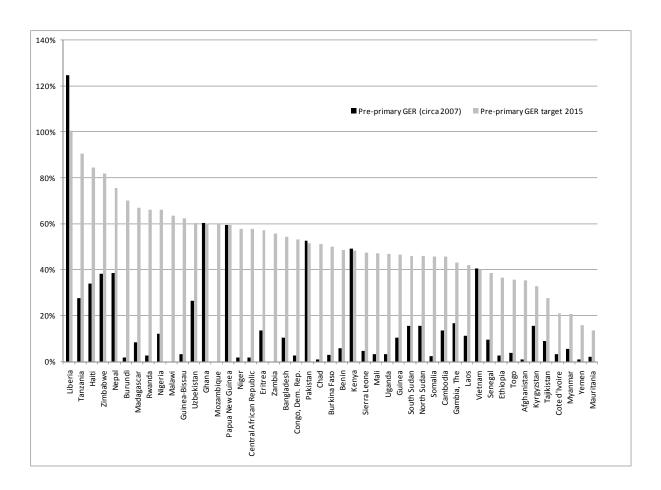

Differences in levels of poverty and current levels of pre-primary enrolment across low-income countries result in different expansion paths for pre-primary enrolment (see Figure 2). But in many countries, targeted expansion at the pre-primary level is enormous. For example, in Niger pre-primary enrolment rates are projected to increase from 2% in 2007 to 58% in 2015. This is equivalent to an additional 1.2 million pre-primary school places being created by 2015. In other countries targets for ECCE do not imply substantial expansion. For example, pre-primary enrolment rates in Kenya are well beyond levels required to provide school places for the estimated 20% of children living below the poverty line.

Figure 2: Current and target rates of pre-primary enrolment

<sup>&</sup>lt;sup>10</sup> This underestimates the proportion of children living below the poverty line as poor families tend to be larger and have more children of primary school age population. However, it was not possible to correct for this underestimation.

<sup>&</sup>lt;sup>11</sup> While not important for the overall national government cost projections it is assumed that private pre-primary schools continued to serve the same share of the pre-primary school age population as they did in 2007.

<sup>&</sup>lt;sup>12</sup> Where the sum was greater than 100% the target was set at 100%.

The target for ECCE included in the costing study represents only one component of the EFA goal and is focussed on a sub-group of the children targeted. Furthermore, the target is unlikely to result in significant increases in enrolment unless complementary interventions occur simultaneously. Providing detailed costings of the complementary health, nutrition and education interventions necessary is difficult to do given the large range of different interventions and policies country's pursue. The costing study does not model these interventions explicitly for every low-income country. However, it estimates that the annual cost of providing these types of interventions for poor children of pre-primary school age is approximately \$1.2 billion. This is equivalent to approximately 6% of GDP per capita (or \$45 per child) for each pre-primary school student living below the poverty line. This accounts for some of the additional interventions necessary, but it still seriously underestimates the investment needs of providing comprehensive early childhood care and education to children from birth to the start of primary schooling.

## Universal primary education

1

<sup>&</sup>lt;sup>13</sup> This is an average of estimated cost of providing demand side interventions for primary and lower secondary school students.

Previous studies have focussed heavily on estimating the costs of achieving universal primary education. This focus is largely due to universal primary education being included in both the EFA goals as well as the broader Millennium Development Goals. Achieving universal primary education has been interpreted in different ways. The Bruns et al study (2003) interpreted the achievement of the goal as all children successfully completing primary school – 'a goal that is achieved when the proportion of children completing primary school in any one year is the same or greater than the number of children of primary school graduation age'. <sup>14</sup> More commonly, studies have used a primary net enrolment rate of 100% as a target for UPE achievement (see for example, Brossard and Gacougnolle, 2000; Delamonica et al., 2001).

Both approaches have their merits. On the one hand, using primary school completion focuses on an education system's capacity to take in and retain children to the end of the primary cycle but 100% completion implies that 100% intake has to be achieved 6-8 years prior. On the other hand, using a target net enrolment rate of 100% ensures that all children of primary school age are in school but does not measure whether children are successfully completing the primary cycle. At the extreme it is possible to have NERs of 100% without any children actually completing primary school.

The current costing study uses an NER target of 100% for the UPE goal. Support for marginalised children and improvements in education quality, outlined in the sections below are assumed to lead to improvements in student progression rates. Costs are projected on the basis that by 2015 all children of primary school age are in school and progress through the system with limited repetition and no dropout. These assumptions are likely to understate the total costs of UPE because they exclude the costs of providing schooling to children outside of the official primary school starting age. 16

#### Expanding lower secondary schooling

Many countries, particularly in Sub Saharan Africa have begun to include targets for basic education (primary and lower secondary schooling) in their national education plans. While targets for lower secondary school enrolment are not explicitly included in the EFA goals, providing opportunities at the lower secondary level are often an important incentive for primary school completion. <sup>17</sup> They can also be seen as an important component of the EFA commitment to providing learning opportunities for young people (EFA Goal 3). For these reasons, the costing exercise explores the costs of expanding lower secondary schooling.

<sup>&</sup>lt;sup>14</sup> The primary school completion rate is defined as the total number of students successfully completing (or graduating from) the last year of primary school in a given year (Bruns et al., 2003).

<sup>&</sup>lt;sup>15</sup> In the simulation model the projections are driven by changes in the primary school intake rate.

<sup>&</sup>lt;sup>16</sup> See Appendix table for current and targeted enrolment rates.

<sup>&</sup>lt;sup>17</sup> Gender parity at the secondary school level is part of the gender parity and equality EFA goal.

Lower secondary school enrolment is expected to increase to the level necessary to ensure that by 2015 all children who complete primary school have a guaranteed lower secondary school place. <sup>18</sup> In many countries, automatic transition from primary to secondary implies very high rates of expansion in a relatively limited period. For example, in Tanzania there are currently lower secondary school places for less than a fifth of the lower secondary school age group. Ensuring that all children completing primary school have a lower secondary school place by 2015 will require providing school places for 83% of the school age population. In many countries, increasing rates of primary school completion also results in lower secondary enrolment continuing to rise substantially after 2015. The rising levels of enrolment will continue to raise the costs of lower secondary school provision beyond 2015.

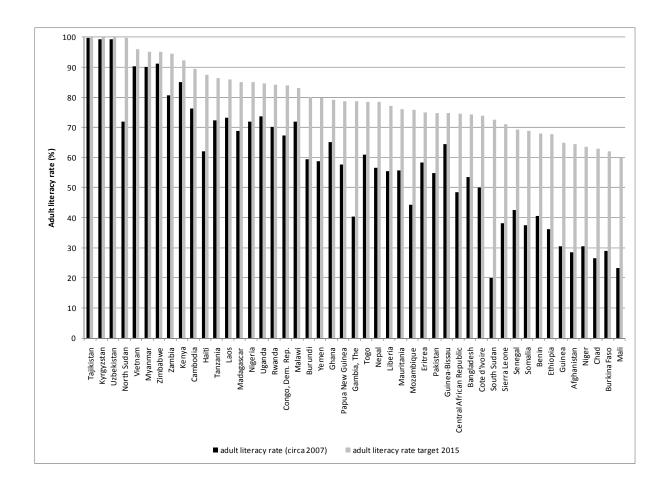

#### Halving adult illiteracy rates

Adult literacy targets for 2015 are country specific and depend on levels of literacy in 1999. Targets are calculated by halving the illiteracy rate in 1999 and using this to calculate a literacy rate target for 2015. Figure 3 illustrates levels of literacy in 2007 and targets for 2015. Differences in the required increase in levels of literacy across countries are the result of different starting points in 1999 and levels of progress since. For example, in Mali the adult literacy rate was 19% in 1998 which implies a target rate of 60% in 2015. But between 1998 and 2007 literacy rates increased by only 4 percentage points requiring accelerated progress over the next 8 years of the projection period.

Figure 3: Current and target literacy rates

-

<sup>&</sup>lt;sup>18</sup> This is equivalent to a 100% transition rate between primary and lower secondary. Universal provision of lower secondary education is assumed but this would only occur after 2015.

Levels of literacy are determined by the number of graduates from adult literacy classes as well as changes in the population with basic levels of education. For the purposes of the costing study it is assumed that adults who have received a minimum of five years of primary education are literate. This implies that expansion of primary schooling opportunities will play a direct role in increasing levels of literacy albeit with a slight delay as children who have completed five years of education reach adulthood. This may appear at first as an optimistic assumption given that studies have shown that significant proportions of students leave primary education without a solid foundation in basic skills such as literacy and numeracy. However, the overall cost estimates include substantial investments in improving the quality of education (see next section) and it is expected that these will result in children obtaining functional literacy skills by the fifth grade. For many countries this source of improvement in literacy is more important in terms of reaching the literacy targets than providing literacy classes for adults.

# Gender parity and equality

<sup>&</sup>lt;sup>19</sup> Children reaching grade 5, are assumed to be spread evenly over the 10-14 age range, and increases in levels of literacy from this source are calculated as the average number of 5th grade students in the previous five years.

The costing model used to project the costs of achieving EFA is gender disaggregated. This can be used to demonstrate the different rates of expansion required for male and female enrolment to achieve the gender parity targets outlined in Table 2. The costs of policies designed to improve the participation of girls in school and to address gender gaps in learning are included as a component of a set of polices to address education marginalisation more generally (see below).

#### Improving education quality

A set of key investments costed in each country is designed to provide the resources necessary to improve education quality (see Table 3). Setting target rates for quality parameters in an exercise of this kind is particularly difficult. Research evidence does not provide clear results on the importance of different inputs into the education process (Fuller, 1987; Hanushek, 1995). Even where particular investments are shown to improve quality the results tend to be country and education level specific. In addition the results are dependent on how these resources are managed, which frequently depends on education system governance. Given these difficulties, targets for key quality parameters are based on previous costing studies and a review of the quality investments contained in national education plans (Bennell, 2009; Bruns et al., 2003; Lewin, 2008).

The study estimates the costs of a number of investments to improve the school environment. Schools in low income countries suffer frequently from overcrowded and poorly maintained classrooms, a lack of qualified teachers and limited resources available for learning materials including textbooks and supplementary reading materials. In countries where pupil teacher ratios are excessively high, the costs of EFA are estimated on the basis of reducing these ratios to more acceptable levels (see Table 3). Target pupil teacher ratios are lowest in pre-primary education. However, in line with other costing studies it is assumed that pre-primary school teachers are able to cover two groups of students per week which effectively halves the costs associated with teacher provision at this level (Van Ravens and Aggio, 2007, 2008).

Low achievement levels are often associated with a poor school environment. Badly ventilated classrooms, leaking roofs, poor sanitation and the lack of materials present significant barriers to effective learning in many schools. One recent survey of primary schools in Nigeria found that over 80% of classrooms in Enugu and 50% in Kaduna either did not have a blackboard, or had one that was barely usable (World Bank, 2008). Such conditions are common in many countries.

Building the necessary classrooms to improve access and at the same time ensuring class sizes small enough for effective learning present enormous challenges for many countries. The costs of achieving EFA are estimated on the basis of building sufficient good quality classrooms to accommodate all students in classes of 35-40. This allows children to be taught in group sizes that are manageable for teachers. Coupled with the pupil teacher ratio targets it also means that each teacher is equipped with a single classroom.

Construction costs are dependent on the type of design selected and different procurement arrangements. For the costing exercise, classroom construction costs were estimated using the results from a detailed survey of primary classroom construction in Sub-Saharan Africa. In the study, two cost scenarios were compared; a high cost option which assumed that current school construction strategies were continued and a low cost option based on countries moving to a community-contracting approach. The average of these high and low options were used in the current costing exercise and also include the costs of office and storage space, furnishings, latrines and the provision of a reliable water supply (Table 3). Resources for annual maintenance are also included to ensure that routine maintenance is carried out and classrooms can be used for the duration of their lifetime.<sup>20</sup>

Rehabilitating the current stock of classrooms is also crucial if education quality is to be improved. A recent study estimated that 30% of the current stock of classrooms in Sub-Saharan Africa were either temporary constructions or in need of serious repair (Theunynck, 2009). Conflict-affected countries face particularly pressing problems. For example, half of Liberia's primary school classrooms were destroyed or sustained major damage during the civil war (Ministry of Education Liberia, 2007). To incorporate improvements in the stock it is assumed that about a quarter of the classrooms in low-income countries need replacing, rising to half in conflict-affected countries. In the costing study, classroom replacement and rehabilitation is expected to be completed by 2015.

Effective learning also requires access to non-salary inputs such as textbooks and other teaching and learning materials, in-service teacher training and ongoing classroom maintenance. In many low-income countries spending on non-salary inputs is very low particularly at the primary level. In Nigeria, less than 30% of the recurrent primary education budget is devoted to non-salary inputs and results in severe shortages of textbooks. In Kano state, Nigeria, a single subject specific textbook at primary school is shared by approximately 16 students (Ministry of Education Kano State, 2008). Without sufficient resources to provide learning materials the ability of teachers to fulfil the objectives of school curricula are seriously impeded. It is difficult in a costing exercise of this kind to calculate the cost of supporting inputs in detail and across different country contexts. Making a third of all recurrent resources available for non-salary spending has been argued by other studies to provide the required level of investment (Bruns et al., 2003).<sup>21</sup> This benchmark is used for pre-primary and primary education. At the secondary level it is assumed that 40% of recurrent spending will be required for these inputs because of the larger number of subjects taught and the need for additional materials (e.g. laboratory supplies).

Table 3: 2015 targets for main cost parameters

|--|

<sup>&</sup>lt;sup>20</sup> Lifetime of a classroom is assumed to be 40 years which implies that on average 2.5% of the classroom stock needs to be replaced each year. Annual maintenance costs for each classroom are estimated at 2% of initial construction cost.

<sup>&</sup>lt;sup>21</sup> It may seem strange to set a target for the proportion of the recurrent budget devoted to non-salary spending before setting the overall recurrent budget. However, targets are set for teacher salaries, the other component of the recurrent budget, in the next sub-section.

Cost drivers			
Teacher salaries			
Sub-Saharan Africa	4.5 times GDP per	4.5 times GDP per	6 times GDP per
	capita	capita	capita
Other countries	3 times GDP per	3 times GDP per	3.5 times GDP per
	capita	capita	capita
Pupil teacher ratio	20	40	35
Percentage of non-salary costs in	33%	33%	40%
recurrent spending			
School building and rehabilitation <sup>1</sup>	\$ 13,500 per	\$ 13,500 per	\$ 17,000 per
	classroom	classroom	classroom

conditional cash transfer programmes,		per marginalized	capita per
school feeding programmes)		student	marginalized student
Supply side interventions (e.g. incentives	-	Additional 20% of per	Additional 20% of per
for qualified teachers to deploy to remote		pupil current costs	pupil current costs
areas, increased resources for schools		per marginalized	per marginalized
serving marginalized groups)		student	student
Effect on per-pupil recurrent costs			
(constant 2007 US\$)			
Estimated current unit costs	106	68	119
Per-pupil costs with additional policy measures 2015	102	125	162

Notes: <sup>1</sup> A maintenance cost of 2% of construction cost is included per classroom per year. Classroom construction costs and rehabilitation include the costs of constructing all necessary school infrastructure (including latrines, school offices and water supply etc.) and designed to allow access for disabled children (Theunynck, 2009)

### Targets for other key cost parameters

Teacher salaries are typically the single biggest component in the education budgets of low-income countries, often accounting for three-quarters of total spending. Levels of teacher pay will therefore be a key factor in the overall costs of achieving EFA. In the costing exercise regional averages are used as the target for primary teacher salaries. In Sub-Saharan Africa this represents higher salary targets than

previous costing exercises (Bruns et al., 2003; Lewin, 2008). Higher targets have been set because relative wages of teachers have been declining since Dakar and further declines appear unlikely. It is also the case that the regional average for Sub-Saharan Africa roughly corresponds to the average salary targets in national education plans (Bennell, 2009).

Between 1985 and 2004 average teacher wages in Sub-Saharan Africa fell from 6 to 4 times GDP per capita in Africa as a whole (Pole de Dakar, 2009). A key driver of these declines in relative teacher wages has been the introduction or greater use of contract, community and untrained teachers. These groups of teachers are paid substantially less than regular civil-service teachers. In a sample of 14 Sub-Saharan African countries approximately half of teachers in the mid 2000s were not regular civil service teachers and were paid on average less than half the regular civil service teacher salary (Pole de Dakar, 2009). For example, in Mali 65% of primary school teachers are contract or community teachers and are paid 1 to 5 times GDP per capita compared to 8 times GDP per capita for regular civil service teachers. These reforms have played a key role in delivering the rapid increases in primary school access seen in the region since Dakar.

In countries that have pursued these reforms most vigorously, average teacher salaries have declined but are still close to the regional average. For example, in six Sub-Saharan African countries where over 30% of teachers are on contract, average teacher salaries were 4.8 times GDP per capita (Pole de Dakar, 2009). Reforms of this kind have also met resistance and it is unclear whether further reductions in the salary bill can be achieved through this route. And in some cases, these reforms are being reversed. In Guinea, where 51% of all primary school teachers were on contract in 2003, it was recently announced that the system of contract teachers would be abolished and these teachers would be transferred onto the civil service pay roll (Bennell, 2009).

For low-income countries outside of SSA, average primary school teacher salaries tend to be lower in terms of GDP per capita. This reflects to a large extent differences in labour market conditions and often the greater purchasing power of salaries in other regions. For these reasons, teacher salaries have been set at a lower ratio to GDP per capita outside of SSA (see Table 3). Targets for lower secondary have been set using the average ratio of salaries in each region between primary and lower secondary (see Table 3). For example, in Sub-Saharan Africa, teachers at the lower secondary level are paid on average a third more than primary school teachers.

The targets used for the global costing exercise are no substitute for detailed analysis at the country level of pay and conditions of teachers. In order to fully assess the appropriate level of pay, information on the likely availability of individuals with the appropriate qualifications and training is required. Levels of pay for similarly qualified individuals in other sectors of the economy also need to be compared with teacher salaries to understand the relative position of teachers. The target rates imply that around one

<sup>&</sup>lt;sup>22</sup> Community teachers are often not paid for out of the state budget. Community and contract teachers are often untrained.

<sup>&</sup>lt;sup>23</sup> This is calculated as a weighted average of the distribution and salary of civil servant and non-civil servant teachers presented in Table 3.1 of Pole de Dakar (2009).

half of all countries would require increases in levels of teacher salaries while the other half would need to explore ways to reduce their overall salary bill.

The EFA goals are based on the belief that basic education should be financed primarily by national governments. Estimates of the costs of achieving EFA are based on the assumption that basic education is provided fee-free in all schools that receive state funding. However, it is assumed that 10% of children in primary and lower secondary schools will attend private fee paying schools that receive little or no state support. Currently, average rates of private school provision in low income countries tend to be higher; approximately 13% (17%) of primary (lower secondary) school places are currently provided privately in low-income countries. It is unlikely that private fee paying schools will be a realistic option for children currently out of school, sot is expected that these children will enrol in greater numbers in fee-free state funded schools. In most countries the absolute number of children attending private schools is still projected to increase. The target for the share of private enrolment in pre-primary education is different than primary because targets for pre-primary enrolment expansion vary across countries (Table 2). It is assumed that the private pre-primary schools continue to serve the same proportion of the pre-primary school age population and that future improvements in enrolment rates are driven by increases in state-funded provision.

#### Reaching and teaching the marginalised

Estimating the costs of reaching marginalised groups is a central objective of the new costing exercise. Many of the improvements in quality and the abolition of fees outlined above will have significant impacts on the participation and learning achievement of marginalised students. However, these general improvements will be insufficient if marginalized children are to be offered equal learning opportunities. The study estimates the costs of introducing policies to address education marginalization in low-income countries. It combines information on the unit cost of programmes with estimates of the size of marginalised populations to estimate the resources required.

An important aspect of improving the participation of marginalised children is to increase incentives for regular attendance at school. In many countries, conditional cash transfer and school feeding programmes have been used to provide additional incentives for school participation. The costs of providing interventions of this kind vary greatly. Recent studies on conditional cash transfers and school feeding programmes show average costs of approximately 5% of GDP per capita (Bundy et al., 2009; Chanamuto, 2009; Fiszbein et al., 2009). These average costs are used to estimate the costs of demand side interventions at the primary level. As the direct and opportunity costs of education tend to rise with age and school level, it is assumed that per-student transfers will be higher at the lower secondary level (see Table 3).

Ensuring that schools have adequate resources and are staffed by qualified and motivated teachers also makes up a central part of any integrated approach to reaching the marginalised. Schools are an

<sup>&</sup>lt;sup>24</sup> These targets are similar to targets in other costing studies (see for example, Bruns et al., 2003).

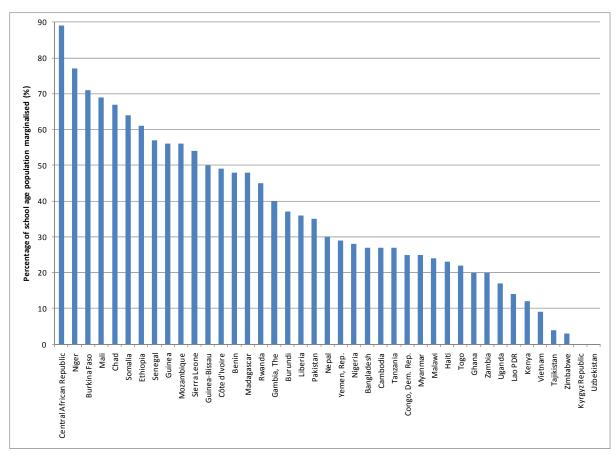

important component of all children's learning opportunities but for the marginalised they frequently represent their only opportunity to learn. In many cases, marginalised children have poorly educated parents who are less able to support their learning outside of school. Additional resources will be required in schools serving marginalized groups if gaps in learning between the marginalised and the rest of the population are to narrow. While the policy mix will vary, additional resources are required to provide supplementary learning materials, increased teaching time and incentives for well qualified teachers to teach in rural and remote schools.

Relatively little information is available on the level of additional resources required for schools serving marginalised groups. It is estimated that schools serving marginalised populations will require 33% more resources per student compared to more conventional schools. This is admittedly a rough estimate but would, for example, provide the resources necessary to introduce an incentive scheme to attract teachers to rural and remote schools. In a recent study of teacher deployment systems in SSA countries, allowances to attract teachers to rural and remote schools were approximately 20% of basic salary (Chen and Mulkeen, 2008). It could also be used to hire two additional teachers in a six teacher school.

A key measure of levels of absolute marginalisation is the proportion of 17-22 year olds with less than 4 years of education. Individuals falling into this group are unlikely to have obtained the basic literacy and numeracy skills necessary to provide a foundation for future learning and employment. In each low income country, this measure of absolute marginalisation is used to proxy for the share of the school age population requiring the interventions outlined in Table 2. The share of the population with less than 4 years of education differs greatly across the low-income countries included in the study (see Figure 4). The definition of marginalisation is intended to cover many different marginalised groups faced with different constraints. The global costings provide an overall envelope of resources for a mix of different interventions necessary to tackle these differing constraints. The particular mix of policies will differ across countries as will the groups that are targeted.<sup>25</sup>

Figure 4: Proportion of the primary and secondary school age populations targeted for programmes aimed at the marginalised

<sup>&</sup>lt;sup>25</sup> In the Bruns et al. (2003) study HIV/AIDS orphans were targeted for specific interventions estimated to cost US\$50 per child.

Notes: Percentages show the proportion of the 17-22 year old population that have less than 4 years of education. Only countries with data included in the figure.

Source: UNESCO-DME (2009).

This measure of marginalisation is only a proxy and in some cases may overestimate the need for targeted programmes. For example, in some countries providing access to good quality education may increase the proportion of children with more than 4 years of education without any need for additional support. Defining the appropriate targeted population in each country needs to take account of context and an understanding of the constraints faced by different marginalised groups. Some will be constrained purely by lack of access to good quality education while others will require substantial support to attend regularly and be provided with the learning opportunities necessary to achieve the competencies associated with basic education. The proxy used in this study is sensible as a cross country measure but is likely to be closer to the real targeted population in some countries compared to others.

This section has outlined the key targets and cost parameters used in the costing exercise. These provide a basis for estimating the costs of achieving EFA. They do not provide a detailed set of policies or reform steps for an individual country to follow. It is also assumed that countries have effectively managed education systems in which resources can be translated effectively into the provision of good quality school places. In reality, many countries will need to introduce changes in the governance of their

education systems alongside resource increases. Reforms of this nature are not necessarily expensive but are imperative if education systems are to function well and utilise additional resources effectively.

#### 4. Results

#### 4.1 Classroom and teacher needs at primary, pre-primary and lower secondary levels

One of the greatest material challenges to reaching EFA is building the necessary classrooms to improve access and at the same time ensuring class sizes small enough for effective learning. The costing study estimates that an additional 4.3 million classrooms will be needed in primary and pre-primary education to achieve EFA. Figure 5 shows that in most countries building primary classrooms is the largest challenge particularly for countries with large school age populations. In Bangladesh, Ethiopia, Pakistan and Nigeria more than 40,000 new primary classrooms are required each year.

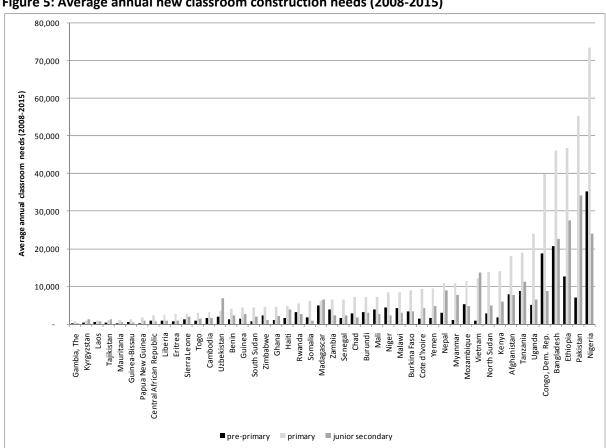

Figure 5: Average annual new classroom construction needs (2008-2015)

Additional classrooms are needed to increase the number of children enrolled, reduce pupil classroom sizes, rebuild existing classrooms that are inadequate and to replace classrooms that have reached the end of their lifespan. In each country the composition of classroom needs will vary according to the initial situation in each country (see Box 2).

Box 2: Classroom needs to achieve UPE

classrooms	72,367	20	16,953	30	8,523	13

Table 4 reports in detail the number of primary school classrooms needed to achieve UPE in three countries included in the costing exercise. Between, 2008 and 2015 Bangladesh will need to provide an additional 2.8 million school places to achieve UPE. At existing pupil classroom ratios this would require the building of 40,000 new classrooms. However, providing the additional classrooms necessary to achieve the targeted class sizes of 40 pupils represents a much greater challenge. Reducing pupil classroom ratios from their current level of 68 to 40 would require building almost 200,000 additional classrooms. In Bangladesh this is clearly the biggest challenge with over 50% of classroom construction needed to lower class sizes.

In Niger, the main UPE challenge is building enough classrooms to accommodate an additional 2 million students. Almost three quarters of the new classrooms are required to accommodate expansion. In contrast to Bangladesh, pupil classroom ratios were already at targeted levels and no additional classrooms are required to reduce class sizes. Burundi is estimated to require a similar number of classrooms as Niger. However, a much greater proportion (30%) of new classroom

construction is required to replace the existing stock of classrooms. This is due to the destruction of schools and the lack of maintenance undertaken during the civil war.

How do average classroom needs compare to current building programmes? In none of the countries highlighted in Table 5 are current rates of construction adequate to achieve EFA. In Burundi, Malawi and Uganda construction needs are estimated to be over 5 times current rates of construction (see Table 5).

Table 5: Primary classroom needs in Sub-Saharan Africa

Source: annual growth in classroom stock taken from Theunynck (2009).

Classroom construction makes up approximately 30% of the total costs associated with achieving EFA across all low-income countries. <sup>26</sup> Compared to the primary level, construction costs tend to be a larger proportion of total costs at the pre-primary and lower secondary school levels because of the more significant expansion projections in most countries. The variation in the share construction costs make up of the total costs for achieving EFA is large. In Burundi, 65% of the total costs of achieving UPE between 2008 and 2015 arise from classroom construction compared to only 12% in Ghana. These differences arise primarily from three factors: <sup>27</sup>

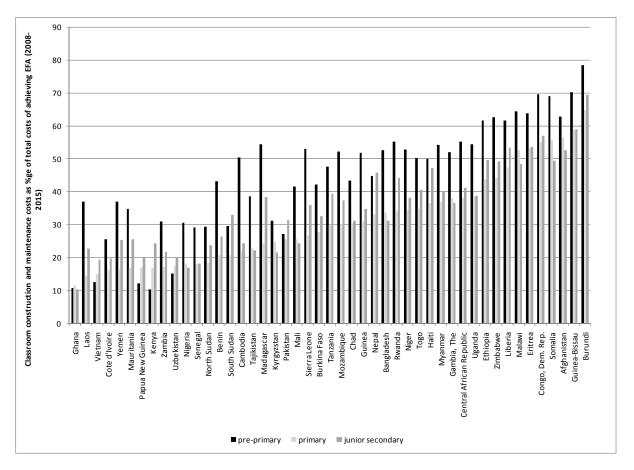

- Burundi is a conflict-affected country and the study estimates that 50% of the existing classroom stock needs to be replaced compared to only 25% in Ghana.
- Pupil classroom ratios in 2007 are also considerably higher in Burundi compared to Ghana (see Appendix table A1). In Burundi, new classroom construction is required to reduce class sizes whereas in Ghana pupil classroom ratios are below the 40:1 threshold.

<sup>&</sup>lt;sup>26</sup> The costs of classroom construction include the cost of latrines, offices, water supply and providing access for children with disabilities.

<sup>&</sup>lt;sup>27</sup> Differences between current and targeted recurrent cost parameters (e.g. teacher salaries) also play a part in explaining the differences but these were not as important as the differences in replacement and pupil classroom ratios outlined in the text.

• GDP per capita is much lower in Burundi, making the fixed construction costs for classrooms relatively more expensive compared to Ghana.

Figure 6: Classroom construction costs as a percentage of total costs of achieving EFA by education level (2008-2015)

High levels of investment in school infrastructure are in most cases temporary. Once education systems have built adequate classrooms to accommodate their school age population infrastructure costs are mainly limited to replacing classrooms that are reaching the end of their 40 year life span and maintaining the existing stock of classrooms. For example, projected average annual costs of primary classroom construction are \$623 million between 2008 and 2015 in Bangladesh compared to only \$174 million between 2016 and 2025 (see Appendix Table C).

Increasing access and improving the quality of education also requires increasing the number of qualified teachers in low-income countries (see Box 3). Annual teacher needs to achieve EFA follow similar patterns as classroom needs with the greatest absolute annual needs in primary (see Appendix Figure 1). Proportional increases to achieve EFA tend to be greatest for the pre-primary and lower

secondary levels (see Figure 7). This often reflects the very limited access children have to these levels in the base year and the large projected expansion necessary to achieve EFA. While the average annual increases can be high they may not reflect large absolute increases in teacher numbers. For example, the number of lower secondary school teachers in South Sudan needs to increase by over 50% every year if all children completing primary are to have a lower secondary school place by 2015 (Figure 7). In absolute figures this implies that approximately 1,750 lower secondary school teachers need to be recruited every year. In primary, a slightly higher number of teachers need to be recruited annually but this only represents a 5% annual increase in the stock of primary school teachers.

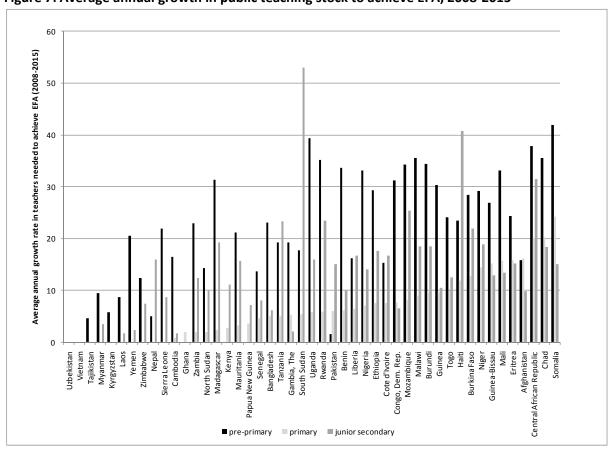

Figure 7: Average annual growth in public teaching stock to achieve EFA, 2008-2015

How do these projected rates of growth in the teaching stock compare to growth rates since 1999? Between 1999 and 2007 annual growth rates in the primary school teacher stock in most countries, with the necessary information, fell far short of the levels of recruitment needed. For example, the stock of primary school teachers grew annually at 10% in Mali but would need to grow at 16% if UPE is to be achieved (UNESCO, 2010). In other countries (e.g. Senegal, Benin, Liberia and Burundi) growth in the teaching stock between 1999 and 2007 exceeded the growth needed to achieve UPE by 2015.

Total teachers needed (2008-2015)	449,210	100	44,315	100	54,253	100

Table 6 reports in detail the number of primary school teachers needed to achieve UPE in Nigeria, Madagascar and Malawi. Between 2008 and 2015, Nigeria will need to recruit an additional 450,000 teachers. Almost half of these teachers are needed to replace teachers that are projected to leave the teaching force between 2008 and 2015. At existing pupil teacher ratios, an additional 104 thousand teachers would need to be recruited to accommodate the 5 million children that would need to be enrolled to achieve UPE. Providing the additional teachers necessary to achieve the targeted class sizes of 40 pupils would require the recruitment of an additional 152 thousand teachers.

In Madagascar, the main UPE challenge is recruiting enough teachers annually to replace teachers that leave the education system. Almost two-thirds of newly recruited teachers are needed because of teacher attrition. Malawi has a similar sized school age population as Madagascar but a higher pupil-teacher ratio implies a greater need for teachers to achieve UPE; 65% of total teacher recruitment is needed to reduce class sizes in Malawi compared to only 32% in Madagascar.

## 4.2 The additional costs of reaching the marginalised

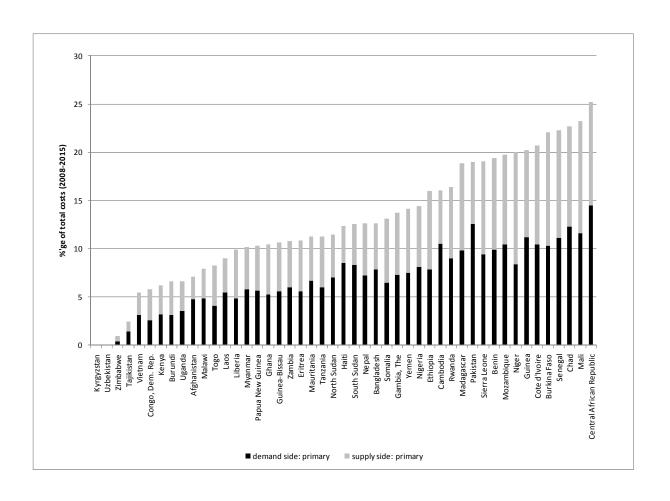

It is expected that improvements in education access and quality will have beneficial impacts on the participation of many groups currently deprived of meaningful education opportunities. For example, effective planning of the large school building programmes included in the cost estimates will bring schools closer to marginalised communities. Even so, in many cases marginalised groups will require additional support if they are to attend school regularly and achieve the learning objectives associated with primary and lower secondary schooling.

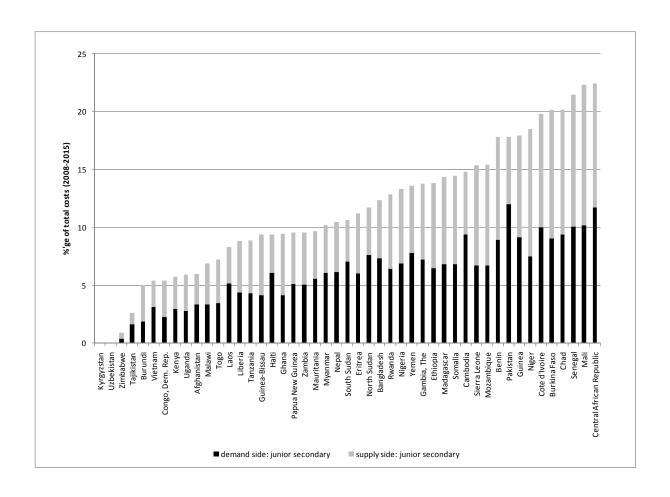

<sup>&</sup>lt;sup>28</sup> An annual teacher attrition rate of 5% is assumed for all levels of education.

The cost of providing this additional support to marginalised children is driven by the size of a country's marginalised population and the cost of these programmes per child. Figure 4 demonstrates the large variations in the estimated proportion of the school age population that is considered to be marginalised for the purposes of the costing study. The per child cost also varies because the costs of demand side interventions are calculated as a proportion of each country's GNP per capita and supply side interventions as a proportion of average recurrent costs per pupil. These factors result in the average unit costs of reaching a marginalised child ranging from \$11 at the primary level in Burundi to \$185 at the lower secondary level in Nigeria. In most countries, the total costs of programmes addressing demand side constraints tend to be slightly higher than programmes aimed at providing additional resources to schools serving marginalised groups.

The costs of reaching the marginalised account for different shares of the total costs of achieving EFA in each low income country (see Figure 8). In Kenya, approximately 6% of the total costs of achieving UPE are estimated to be needed to address education marginalisation while in Chad these costs account for over 20% of the total. These differences are largely driven by differences in the estimated proportion of the school age population classified as marginalised. In Kenya, 12% of the school age population is estimated to be educationally deprived (see earlier figure) compared with 67% in Chad. The share of total costs needed to reach marginalised groups is therefore much higher in Chad. At the primary level 23% of total costs are required for targeted programmes compared to only 6% in Kenya.

Figure 8: The costs of reaching the marginalised

## 4.3 Summary costs for achieving EFA

The total costs of achieving EFA in the forty-six low-income countries covered in the study are outlined in Table 7. These are calculated by aggregating the costs for each country's costing model (see Appendix Table C). The main results are:

- Cumulative costs over 2008-2015 for the basic education goals run to US\$286 billion, or US\$36 billion annually (in constant 2007 US\$). Approximately, \$12 billion of domestic resources are currently being allocated to basic education annually.
- US\$ 3.7 billion, or 14% of annual spending on primary education is required to finance programmes and interventions aimed at reaching the marginalized. A slightly greater proportion of these resources (57%) are required for demand side interventions.
- Providing new classrooms, including the replacement, repair and rehabilitation of old classrooms account for 30% of all costs associated with achieving the basic education goals.
- Teacher costs account for 40% of the total costs for basic education.

 Including lower secondary education into the costing scenario increases the cumulative costs by US\$120 billion, or an average annual cost of US\$ 15 billion. This represents an additional 30% over basic education costs.

Table 7: Costs of achieving Education for All in low-income countries (constant 2007 US dollars, billions)

US\$ billions (constant 2007 prices)	Pre- primary	Primary	Adult literacy	Basic education sub-total	Lower secondary	TOTAL
Current domestic resources	0.8	11.1	-	11.9	4.7	16.6
Cumulative cost (2008-2015)	60.4	220.4	5.1	285.9	120.2	406.1

Other costs	20	20	-	20	22	21

## 5 Meeting the costs of EFA

#### 5.1 Domestic resource mobilisation

The estimated levels of spending required to achieve the EFA goals greatly exceed current levels of spending (see Table 7). However, many low-income countries can increase domestic spending on education to narrow the gap between current and required levels of spending to achieve EFA. The extent to which domestic resources can be increased will depend on economic growth, levels of government revenue and the share of government revenues allocated to basic education. For the costing exercise a set of target values were set for 2015 to project the level of domestic resources available between 2007 and 2015. These targets were based on previous costing exercises and related work (see Table 8):

- Economic growth IMF world economic outlook growth projections for 2007-2014 are used to project levels of national income from 2008 to 2015. These projections take account of the estimated reductions in growth resulting from the 2008 financial crisis.<sup>29</sup>
- Government revenue (excluding grants) as a percentage of GDP. This target is based on the
  acceptable level of domestic revenue effort for the CFA Franc Zone (see Martin and Kyrili,
  2009). However, in some countries mineral wealth suggest much higher rates of domestic

<sup>29</sup> Economic growth projections were taken from the April 2009 World Economic Outlook Database (IMF, 2009). See Chapter 1 of UNESCO-GMR for further discussion of the changes in economic growth forecasts (UNESCO, 2010).

resource mobilisation are possible. For example, in Nigeria domestic revenue was 29% of GDP in 2007 (see Appendix Table B1) largely due to revenue from oil and gas. Therefore the costing study assumes that countries already exceeding the target remain at the higher level.

- Education's share of the national budget. Raise the share of the government budget devoted to education to 20%. This target is based on the Bruns et al. study and is widely used as a benchmark for levels of national commitment to achieving EFA (Bruns et al., 2003). For countries already exceeding the target it was assumed the ratio remained at the higher level.
- Share of the education budget devoted to basic education and lower secondary. The appropriate composition of the education budget will be dependent on the priority afforded to EFA. The costing study assumes that a large proportion of the education budget will be devoted to basic education. Benchmarks from the World Bank study are used for the share allocated to primary education and for each country depend on the duration of primary schooling (Bruns et al., 2003; Fast Track Initiative, 2006). Allocations to secondary are calculated according to the duration of primary. For example, the target for secondary for a country with a primary cycle of 6 years is 30%. Allocations between lower and senior secondary are then based on the number of years, size and relative costs of the two sub-cycles. Appendix Table B1 provides the full details of assumptions for each country.

Table 8: Targets for domestic resource mobilisation

Parameters	2007 average	2015 target
Annual rate of economic growth	-	5%*
Government revenue (excluding grants) as a %ge of GNP	14%	17%
Share of government resources going to education (%)	17%	20%
Share of education spending to:		
Pre-primary	3%	5%
Primary	50%	34%-58%
Lower secondary	16%	9%-27%

Notes: \* this is the average annual growth rate between 2007 and 2015 used to estimate resource availability. Country targets for the composition of the government education budget are based on the duration of each level of schooling.

Most low-income countries can mobilise additional resources if they satisfy the set of thresholds outlined in Table 8. Figure 9 outlines the additional resources that would be realised for spending on primary if the targets set out in Table 8 are realised. Chad raises 27% of national income in government revenue, but has one of the lowest levels of commitment to primary education among low-income countries. Pakistan performs poorly on all three components; government revenue represents a small share of national income, the share of revenue spent on basic education is among the lowest for any of

<sup>&</sup>lt;sup>30</sup> The target assumes a) senior secondary per-pupil costs are double those at lower secondary and b) enrolment in lower secondary is double enrolment at senior secondary. These assumptions are based on Lewin (2008).

the countries included and the share spent on primary the lowest in the group. The country has the potential to more than triple the share of GDP currently allocated to basic education. However, some countries such as Benin and Mozambique are already close to the resource levels implied by the targets. The scope to close the gap between required resources and those that can be raised domestically is more limited in these countries.

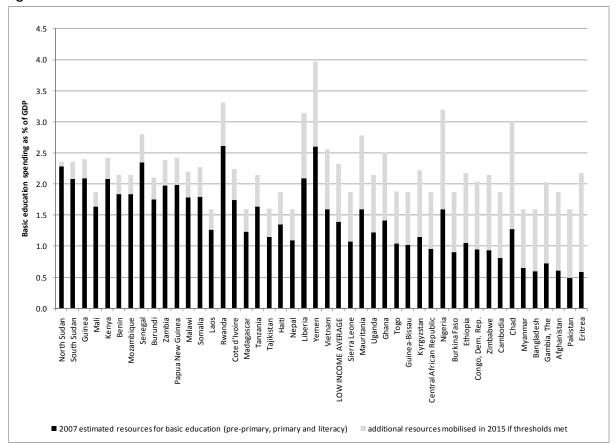

Figure 9: Additional resources countries could devote to basic education as a share of GDP

#### 5.2 Remaining financing gaps

Despite increases in domestic revenue mobilisation, financing gaps remain in most low-income countries. <sup>31</sup> Table 9 provides a detailed breakdown of the aggregate financing gap in the 46 low-income

<sup>&</sup>lt;sup>31</sup> The financing gaps, shown in Figure 10, are defined as the shortfall between the domestic resources mobilised if all the financing thresholds are met and the resources required to achieve EFA.

countries covered in the study.<sup>32</sup>The overall financing gap for basic education is estimated at US\$16.2 billion annually (Table 9).

Despite substantial progress since 2000, shortfalls at the primary level account for approximately 60% of the total basic education financing gap. The bulk of the remaining financing gap occurs at the preprimary level where projected enrolment expansion is the greatest. Under the targets outlined in Table 9, pre-primary enrolment is projected to quadruple between 2007 to 2015 from 17 to 67 million (see Appendix Table C). Combining these large enrolment increases with a fixed resource allocation of 5% of national education budgets gives rise to the relatively large financing gaps at this level.

An additional US\$ 7.9 billion financing gap is associated with the target of ensuring that all primary school graduates have a guaranteed lower secondary school place of acceptable quality. Including these targets raises the overall annual education financing gap to US\$ 24.1 billion. The costing exercise demonstrates that the costs of extending universal education to the lower secondary level in low-income countries represents a substantial increase in the financing gap. In many countries it will not be possible to pursue all aims together. Ways of delivering education more effectively are urgently needed.

Table 9: Average annual financing gaps in low-income countries, 2008-2015

	Financing gap (constant 2007 US\$ billions)	Sub-Saharan Africa (%)	South Asia (%)	Conflict- affected countries (%)
Education level				
Pre-primary	5.8	74	22	29
Universal primary education	9.8	68	28	48
Adult literacy	0.6	42	37	51
Basic education financing gap	16.2	69	27	42
Lower secondary	7.9	57	37	43
Total financing gap	24.1	65	30	43

Notes: The financing gap is the difference between the total investment requirement indicated by the costing exercise and levels of domestic financing associated with all countries reaching the financing thresholds by 2015. The pre-primary financing gap includes \$1.2 billion for additional health, nutrition and education interventions.

There are considerable differences in the size of financing gaps across low income countries. High population countries, such as Bangladesh, Nigeria and Pakistan, tend to have large absolute financing gaps owing to the large number of children the school system has to accommodate (see Figure 10). However, the relative size of the financing gap varies considerably. In Nigeria and Pakistan the UPE financing gap represents 10% and 33% of the total resources required between 2008 and 2015 respectively (see Appendix Table C). In DRC and Ethiopia, the financing gap represents over 70% of the required resources.

<sup>&</sup>lt;sup>32</sup> In some countries, for specific years and levels of education projected resources exceed costs. These surpluses are set at zero and are not reallocated to other levels or years.

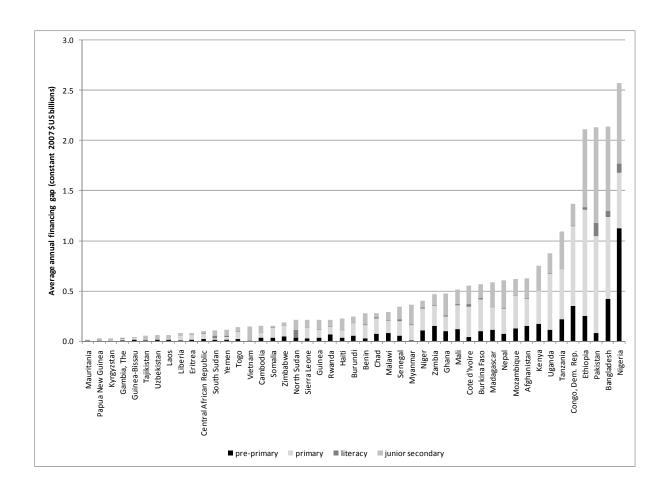

Much of the difference in the relative size of the financing gap is related to the fixed costs of classroom construction, GDP per capita, and the overall need for new construction. In countries with a lower GDP per capita, the fixed, absolute costs of classroom construction create a larger burden on the GDP resources; these countries, and those where the construction needs are greatest, are those where the financing gap percentages are largest. Differences in levels of poverty and the proportion of the school aged population that is marginalised also explain differences in the financing gap across countries. Where poverty is higher, targets for pre-primary schooling are more ambitious; and where levels of education poverty are higher, the costs of reaching the marginalised are also higher.

Primary and lower secondary schooling make up the bulk of the financing gap in most low-income countries. On average, almost 80% of the total financing gap is concentrated at these levels. However, there are large variations. In Nigeria, for example, over 40% of the financing gap is at the pre-primary level. This is largely due to the enormous increases in enrolment associated with the targets set (see Figure 2). Financing gaps do not exist at the pre-primary and primary levels In Viet Nam; lower secondary education accounts for 93% of the small financing gap shown in Figure 10.

Figure 10: Average annual financing gaps (2008-2015)<sup>33</sup>

\_

<sup>&</sup>lt;sup>33</sup> Pre-primary financing gaps exclude additional health, nutrition and education interventions (see Section ).

# 5.3 Longer term financing gap projections to 2025

Additional effort in mobilising resources is clearly needed if financing gaps are to close and the EFA goals achieved. But even if these gaps can be closed will achieving the goals result in education systems with unsustainable levels of cost? To explore sustainability issues projections were calculated beyond 2015 (see Appendix Table C). These projections assume that education systems continue to operate at the target levels outlined in previous sections. They also assume that economic growth continues at the same rate as projected for 2008 to 2015. Costs continue to rise because of population growth and because key costs are linked to economic growth (e.g. teacher salaries are expected to grow at the same rate as national income per capita). The key findings from exploring these longer term trends are:

- After 2015 there is a drop in overall spending because the large school building programmes necessary to achieve the EFA goals at the pre-primary and primary levels are completed.
- Overall financing gaps at the primary level begin to close. The total primary financing gap falls from an average of \$9.8 billion between 2008-2015 to \$8 billion between 2016-2025. In a minority of countries primary school financing gaps continue to rise. For example, in

- Afghanistan, population growth and the pace of expansion result in financing gaps increasing from \$168 million during 2008-2015 to \$471 million during 2016-2025.
- Financing gaps continue to grow at pre-primary. At the pre-primary level, average annual financing gaps increase from \$4.5 to \$5.7 billion between the two projection periods.<sup>34</sup>
- In the long term financing gaps are expected to increase substantially at the lower secondary level. Further expansion in the coverage of the lower secondary education system is required if the increased number of children reaching the end of primary are to be guaranteed a school place. The longer term financing gap projections suggest that financing gaps at this level will more than double in the later period (2016-2025).

# 6. Conclusion

The results of the costing exercise show that even with increased domestic revenue mobilisation effort, low-income countries will be unable to meet the EFA goals without significant amounts of international aid. At the basic education level an estimated annual financing gap of \$16 billion will need to be closed if the basic education goals are to be achieved. Current levels of aid for basic education in these countries fall far short of what is needed. The most recent data for 2006-2007 show that of the \$4.9 billion in aid commitments to basic education only \$2.7 billion are directed at the 46 low income countries included in this study.

Current levels of aid are likely to overestimate the contribution of external resources to filling the financing gap. The estimated financing gaps are based on the costs of paying for teachers, building schools and providing learning materials. A significant proportion of current aid is not spent directly on the core costs estimated in the study but on technical support. This is not to argue that technical support is not important but support of this kind falls outside of the requirements estimated here.

Significant increases in aid to basic education are required if the EFA goals are to be achieved in these low-income countries. These increases can come about through a number of different channels but it seems likely that a greater prioritisation of aid to basic education in these countries will be necessary. In 2006-2007, only 22% of all aid commitments to education were spent on basic education in low-income countries.

It will be important to explore innovative ways of increasing levels of external financing for basic education. Global health funds have been successful in attracting major philanthropic contributions and have developed innovative financing mechanisms to increase external support (Sridhar and Tamashiro, 2009). If the gap in financing is to be filled it will be necessary to draw on these experiences in health and exploit the opportunities presented by the emergence of new donors as well as to develop new initiatives to increase external funding.

<sup>&</sup>lt;sup>34</sup> This excludes the complementary health, nutrition and education interventions described in Section 3.1.

Increasing the resources available to education is only one part of the picture. Domestic and external resources need to be spent efficiently to ensure that increased spending has the desired outcome. Well governed and managed education systems are at the heart of ensuring that resources are distributed according to need and that education planning is in line with national goals. In many low-income countries these systems require strengthening and particularly in countries recently affected by conflict.

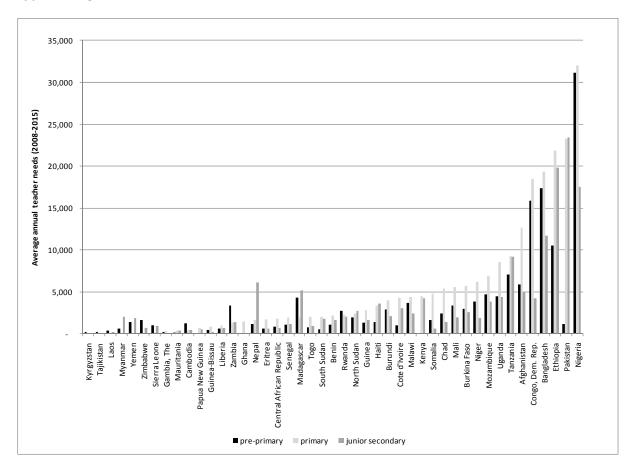

The strengthening of public financial management systems will also be required if national development goals are to be achieved. These systems are important both in terms of translating national education plans into actual resource allocations as well as ensuring government funds are spent appropriately. It is important for these systems to be used to allocate both domestic and international resources for education. Where they are functioning well, donors need to channel greater amounts of aid through national financial management systems to lower transaction costs and ensure that aid is aligned with national education goals.

Ensuring a predictable flow of resources in the medium term is crucial if the investments necessary to achieve the education goals are to be planned effectively. National ministries are unlikely to put in place programmes of school construction unless they can be sure that over the medium term they have the resources to provide sufficient teachers to these new schools. It is important that finance ministries provide an indication of the level of funding, both from national and international sources, the education system will receive over the medium term. This will allow education ministries to plan the necessary expansion required for EFA more effectively.

The limitations of the approach used to estimate the resources required to achieve EFA have been clearly highlighted. However, the magnitude of the estimated financing gaps demonstrate that without a rapid and concerted effort to increase the resources available for education, low-income countries will not achieve EFA by 2015.

<sup>\*</sup> Italicized data values and "--" indicate that there was no data found and estimates were made by the EPDC and the GMR team. Please refer to EPDC, 2010, "HIPE-GMR data description" for methodology used for estimates. Data for different school levels from different years are marked with asterisks (2005/6\*/7\*\*" indicates that data from 2006 have one asterisk next to data value and data from 2007 two asterisks).

### APPENDIX TABLE A2. BASE YEAR DATA SOURCE \*

Indicators	School level	Data Sources
Gross Enrollment Rate (GER)	Pre-primary	Chang, Martinez, and Mputu (2009): Congo, Dem. Rep., Nigeria, North Sudan; Nation Master: Haiti; UNESCO Institute for Statistics: Afghanistan, Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Cote d'Ivoire, Eritrea, Ethiopia, Gambia, The, Ghana, Guinea, Guinea-Bissau, Kenya, Kyrgyzstan, Laos, Liberia, Madagascar, Mali, Mauritania, Myanmar, Nepal, Niger, Pakistan, Papua New Guinea, Rwanda, Senegal, Sierra Leone, Tajikistan, Tanzania, Togo, Uganda, Uzbekistan, Vietnam, Yemen, Zimbabwe.
	Primary	Chang, Martinez, and Mputu (2009): Congo, Dem. Rep., Nigeria; Calculated based on multiple sources: North Sudan, South Sudan; UNESCO Institute for Statistics: Afghanistan, Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Cote d'Ivoire, Eritrea, Ethiopia, Gambia, The, Ghana, Guinea, Guinea-Bissau, Kenya, Kyrgyzstan, Laos, Liberia, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Pakistan, Papua New Guinea, Rwanda, Senegal, Sierra Leone, Tajikistan, Tanzania, Togo, Uganda, Uzbekistan, Vietnam, Yemen, Zambia, Zimbabwe.
Grade 1 Intake Rate	Primary	Chang, Martinez, and Mputu (2009): North Sudan, South Sudan; Demographic and Health Surveys (DHS Dataset): Haiti; Calculated based on multiple sources: Congo, Dem. Rep., Nigeria, Papua New Guinea; Multiple Indicator Cluster Survey (MICS Dataset): Somalia; UNESCO Institute for Statistics: Afghanistan, Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Cote d'Ivoire, Eritrea, Ethiopia, Gambia, The, Ghana, Guinea, Guinea-Bissau, Kenya, Kyrgyzstan, Laos, Liberia, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Pakistan, Rwanda, Senegal, Sierra Leone, Tajikistan, Tanzania, Togo, Uganda, Uzbekistan, Yemen, Zambia, Zimbabwe.
Repetition Rate	Primary	Chang, Martinez, and Mputu (2009): Congo, Dem. Rep.; Calculated based on multiple sources: Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Cote d'Ivoire, Eritrea, Ethiopia, Ghana, Guinea, Guinea-Bissau, Kenya, Kyrgyzstan, Laos, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Nigeria, North Sudan, Pakistan, Rwanda, Senegal, South Sudan, Tajikistan, Tanzania, Togo, Uganda, Uzbekistan, Vietnam, Yemen, Zambia; Calculated based on multiple sources - DHS: Haiti, Liberia, Zimbabwe; Education Sector Plan: Gambia, The, Sierra Leone; Multiple Indicator Cluster Survey (MICS Dataset): Somalia; UNESCO International Bureau of Education, World Data on Education 6th Ed (2007): Papua New Guinea.
	Lower secondary	Calculated based on multiple sources: Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Congo, Dem. Rep., Cote d'Ivoire, Eritrea, Ethiopia, Ghana, Guinea, Kyrgyzstan, Laos, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Nigeria, North Sudan, Pakistan, Senegal, South Sudan, Tajikistan, Tanzania, Togo, Uganda, Uzbekistan, Vietnam, Yemen, Zambia; Calculated based on multiple sources - DHS: Haiti, Kenya, Liberia, Rwanda, Zimbabwe; Education Sector Plan: Gambia, The, Sierra Leone; Multiple Indicator Cluster Survey (MICS Dataset): Somalia.
Dropout Rate	Primary	Chang, Martinez, and Mputu (2009): Congo, Dem. Rep.; Calculated based on multiple sources: Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Cote d'Ivoire, Eritrea, Ethiopia, Ghana, Guinea, Kenya, Kyrgyzstan, Laos, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Nigeria, North Sudan, Pakistan, Papua New Guinea, Rwanda, Senegal, Sierra Leone, South Sudan, Tajikistan, Tanzania, Togo, Uganda, Uzbekistan, Vietnam, Yemen, Zambia; Calculated based on multiple sources - DHS: Haiti, Liberia, Zimbabwe; Education Sector Plan: Gambia, The; Multiple Indicator Cluster Survey (MICS Dataset): Somalia.
	Lower secondary	Calculated based on multiple sources: Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Chad, Cote d'Ivoire, Eritrea, Ethiopia, Ghana, Guinea, Kyrgyzstan, Laos, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Nigeria, North Sudan, Pakistan, Senegal, Sierra Leone, South Sudan, Tajikistan, Tanzania, Togo, Uzbekistan, Vietnam, Yemen, Zambia; Calculated based on multiple sources - DHS: Haiti, Kenya, Liberia, Rwanda, Uganda, Zimbabwe; Education Sector Plan: Gambia, The; Multiple Indicator Cluster Survey (MICS Dataset): Somalia.
Transition Rate	To secondary	Chang, Martinez, and Mputu (2009): Congo, Dem. Rep.; Demographic and Health Surveys (DHS Dataset): Haiti, Kenya, Liberia; Calculated based on multiple sources: Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Cote d'Ivoire, Eritrea, Ethiopia, Ghana, Guinea, Guinea-Bissau, Kyrgyzstan, Laos, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Nigeria, North Sudan, Pakistan, Senegal, South Sudan, Tajikistan, Tanzania, Togo, Uganda, Uzbekistan, Vietnam, Yemen, Zambia; Education Sector Plan: Gambia, The; Ministry of Education, Science, Technology, and Scientific Research: Rwanda; Multiple Indicator Cluster Survey (MICS Dataset): Somalia; Pole de Dakar: Sierra Leone; UNESCO Institute for Statistics: Zimbabwe.
Marginalized Children (% of School-age Children)	All	2010 GMR estimates
% of Pupils in Private Schools	Pre-primary	Chang, Martinez, and Mputu (2009): Congo, Dem. Rep., North Sudan; Calculated based on multiple sources: Nigeria; UNESCO Institute for Statistics: Afghanistan, Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Chad, Cote d'Ivoire, Eritrea, Ghana, Guinea, Guinea-Bissau, Kenya, Kyrgyzstan, Laos, Madagascar, Mauritania, Myanmar, Nepal, Niger, Senegal, Sierra Leone, Tanzania, Togo, Uganda, Uzbekistan, Vietnam, Yemen; Zimbabwe EPPSIM model data: Zimbabwe.
	Primary	Chang, Martinez, and Mputu (2009): Congo, Dem. Rep., North Sudan, South Sudan; Calculated based on multiple sources: Nigeria, Tajikistan; Ethiopia FTI Projections Model: Ethiopia; Financing Basic Education in Bangladesh, Al-Samarrai: Bangladesh; Liberia 2008 Census: Liberia; UNESCO Institute for Statistics: Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Cote d'Ivoire, Eritrea, Gambia, The, Ghana, Guinea, Guinea-Bissau, Kenya, Kyrgyzstan, Laos, Madagascar, Malawi, Mali, Mauritania, Mozambique, Nepal, Niger, Pakistan, Rwanda, Senegal, Sierra Leone, Tanzania, Togo, Uganda, Vietnam, Yemen, Zambia; World Bank Haiti Education for All Website: Haiti; Zimbabwe EPPSIM model data: Zimbabwe.
	Lower secondary	Chang, Martinez, and Mputu (2009): North Sudan, South Sudan; Calculated based on multiple sources: Congo, Dem. Rep., Haiti, Nigeria, Tajikistan; Education spending and equity in Bangladesh, Al-Samarrai: Bangladesh; Ethiopia FTI Projections Model: Ethiopia; Liberia 2008 Census: Liberia; UNESCO Institute for Statistics: Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Cote d'Ivoire, Eritrea, Gambia, The, Ghana, Guinea, Guinea-Bissau, Kenya, Kyrgyzstan, Laos, Madagascar, Malawi, Mali, Mauritania, Mozambique, Nepal, Niger, Pakistan, Rwanda, Senegal, Sierra Leone, Tanzania, Togo, Uganda, Vietnam, Yemen, Zambia; Zimbabwe EPPSIM model data: Zimbabwe.

<sup>\*</sup> This table includes data sources of actual data collected from various sources. For estimates in italics in APPENDIX TABLE A1, please refer to EPDC, 2010, "HIPE-GMR data description" for estimation methodology.

<sup>\*</sup> Target values for year 2010 are marked with an asterisk next to data values.

\*\* Countries affected by conflict are assumed to need 50% of classrooms replaced and all other 25%.

<sup>\*\*\*</sup> All school levels include pre-primary, primary, and lower secondary.

 $<sup>\</sup>ensuremath{^{*}}$  Financing gap in data table excludes budget surpluses from each year.

<sup>\*\*</sup> Total financing gap also includes the gap for literacy training.

 $<sup>\</sup>ensuremath{^{*}}$  Financing gap in data table excludes budget surpluses from each year.

 $<sup>\</sup>ensuremath{^{**}}\textsc{Total}$  financing gap also includes the gap for literacy training.
